19 October 2026

SouthState Bank

Attention: Information Security Officer

Dear Information Security Officer,

Quantum Ready Labs is a free, open-source service of the Manteiga Foundation, a Florida public benefit company. It tests one thing: whether a web host's TLS configuration is ready for the post-quantum transition that NIST, the NSA and the major browsers began in 2024.

On 19 October 2026 we included southstatebank.com in a review of 81 Florida-headquartered banks and credit unions. It was tested exactly as a browser visit would be: fourteen TLS handshakes and one ordinary connection, nothing more. Its result is EXPOSED, 29 of 100. TLS 1.3 is not available: sessions can be recorded today and decrypted later. The change is within reach: 24 of the 81 are already Ready.

Nothing is broken today. The concern is "harvest now, decrypt later": traffic recorded now can be read once a large enough quantum computer exists, and records of an institution's customers keep their value for decades. The fix lives in the key exchange and is, in most deployments, a configuration or CDN setting rather than a project.

The one change that moves it: Enable TLS 1.3. Hybrid post-quantum key exchange is a TLS 1.3 feature. Every current server stack has TLS 1.3; enabling it is the first step and costs nothing else.

The full report, with the method and the standards it follows, is at the link and code at right; the page is unlisted and downloads as a PDF. This letter asks nothing of you. If a conversation would help, my address is below.

Respectfully,

southstatebank.com

Seacoast Bank

Attention: Information Security Officer

Dear Information Security Officer,

Quantum Ready Labs is a free, open-source service of the Manteiga Foundation, a Florida public benefit company. It tests one thing: whether a web host's TLS configuration is ready for the post-quantum transition that NIST, the NSA and the major browsers began in 2024.

On 19 October 2026 we included seacoastbank.com in a review of 81 Florida-headquartered banks and credit unions. It was tested exactly as a browser visit would be: fourteen TLS handshakes and one ordinary connection, nothing more. Its result is AT RISK, 49 of 100. TLS 1.3 with forward secrecy, no post-quantum key exchange: safe today, harvestable. The change is within reach: 24 of the 81 are already Ready.

Nothing is broken today. The concern is "harvest now, decrypt later": traffic recorded now can be read once a large enough quantum computer exists, and records of an institution's customers keep their value for decades. The fix lives in the key exchange and is, in most deployments, a configuration or CDN setting rather than a project.

The one change that moves it: Enable hybrid post-quantum key exchange (X25519MLKEM768). OpenSSL 3.5 or later, nginx 1.27 or later and Caddy 2.9 or later offer it by default; most CDNs have a post-quantum setting. Current Chrome, Firefox, Safari and curl already ask for it on every connection.

The full report, with the method and the standards it follows, is at the link and code at right; the page is unlisted and downloads as a PDF. This letter asks nothing of you. If a conversation would help, my address is below.

Manteiga Foundation · jaime@manteiga.org

19 October 2026

McCoy Federal Credit Union

Attention: Information Security Officer

Dear Information Security Officer,

Quantum Ready Labs is a free, open-source service of the Manteiga Foundation, a Florida public benefit company. It tests one thing: whether a web host's TLS configuration is ready for the post-quantum transition that NIST, the NSA and the major browsers began in 2024.

On 19 October 2026 we included mccoyfcu.org in a review of 81 Florida-headquartered banks and credit unions. It was tested exactly as a browser visit would be: fourteen TLS handshakes and one ordinary connection, nothing more. Its result is EXPOSED, 19 of 100. TLS 1.3 is not available: sessions can be recorded today and decrypted later. The change is within reach: 24 of the 81 are already Ready.

Nothing is broken today. The concern is "harvest now, decrypt later": traffic recorded now can be read once a large enough quantum computer exists, and records of an institution's customers keep their value for decades. The fix lives in the key exchange and is, in most deployments, a configuration or CDN setting rather than a project.

The one change that moves it: Enable TLS 1.3. Hybrid post-quantum key exchange is a TLS 1.3 feature. Every current server stack has TLS 1.3; enabling it is the first step and costs nothing else.

The full report, with the method and the standards it follows, is at the link and code at right; the page is unlisted and downloads as a PDF. This letter asks nothing of you. If a conversation would help, my address is below.

Respectfully,

Jaime Manteiga

First Commerce Credit Union

Attention: Information Security Officer

Dear Information Security Officer,

Quantum Ready Labs is a free, open-source service of the Manteiga Foundation, a Florida public benefit company. It tests one thing: whether a web host's TLS configuration is ready for the post-quantum transition that NIST, the NSA and the major browsers began in 2024.

On 19 October 2026 we included firstcommercecu.org in a review of 81 Florida-headquartered banks and credit unions. It was tested exactly as a browser visit would be: fourteen TLS handshakes and one ordinary connection, nothing more. Its result is AT RISK, 57 of 100. TLS 1.3 with forward secrecy, no post-quantum key exchange: safe today, harvestable. The change is within reach: 24 of the 81 are already Ready.

Nothing is broken today. The concern is "harvest now, decrypt later": traffic recorded now can be read once a large enough quantum computer exists, and records of an institution's customers keep their value for decades. The fix lives in the key exchange and is, in most deployments, a configuration or CDN setting rather than a project.

The one change that moves it: Enable hybrid post-quantum key exchange (X25519MLKEM768). OpenSSL 3.5 or later, nginx 1.27 or later and Caddy 2.9 or later offer it by default; most CDNs have a post-quantum setting. Current Chrome, Firefox, Safari and curl already ask for it on every connection.

The full report, with the method and the standards it follows, is at the link and code at right; the page is unlisted and downloads as a PDF. This letter asks nothing of you. If a conversation would help, my address is below.

Respectfully,
